

# Robot systems

More than just 6 axes at work

# Robot systems

Example of an implemented robot system in the automotive industry.

We are in a position to offer highly complex systems thanks to our long-standing experience in designing, building, and programming robot systems. And we're not tied to any one robot manufacturer – instead, depending on the application, we use Kuka, Stäubli, or Fanuc robots.

The robot systems can optionally be equipped with our specially developed processes, such as measurement, deburring, labelling, cleaning, as well as other processes. Connections to high-bay warehouses for parts storage are also possible and have previously been implemented.

## Features:

- Workpiece handling and process integration – all from a single source
- The integration of measuring stations allows automatic dimensional corrections
- Our WeConnect software package helps you to operate the line with a high OEE
- Line connection to MES or ERP systems

Integration of all well-known robot brands.

# FANUC KUKA

# STÄUBLI ABB

Example of an implemented robot system in the aviation industry.
